Abstract

5 The invention relates to a tubular compression bandage of elastic textile material,
said compression bandage being provided with a plurality of tightening straps
adjacently encompassing the bandage. The tightening straps are fastened by their
starting portions to a starting longitudinal strip connected to the outer surface of
the bandage and are guided circumferentially in pairs at an oblique angle of up to
10 30° with respect to the longitudinal direction of the bandage to their terminating
portions on the side opposite the starting longitudinal strip to pairs of securing
eyes arranged in herringbone-like manner and are folded back therein to form
Velcro-type fasteners on the bandage, the degree of oblique guiding being adjust-
able through selectable fixing of the starting and/or terminating portions of the
15 tightening straps in the longitudinal direction of the bandage.
